R语言暑期训练第一次作业

- 1. 将 movie_star 导入 rstudio 中,并给表格加上列标题;统计每个明星各主演了几部电视 剧;显示前三甲的信息;将统计结果绘制成条形统计图(提示: barplot 函数),并给统 计图上成淡蓝色。
- 2.计算表格明星们出演电视剧次数的最大值,最小值,中位数,平均值;并将上述结果绘制成表格,要求 4m 的标题排成一列,即一行代表一种数据。
- 3.采用两种方法生成从 3 到 37 的整数序列,并将其转换成字符型;将大于 20 的筛选出来,并求其和。

答案:

```
movie_star = read.table("movie_star.txt",col.name = c("movie","star"))
top = sort(table(movie_star\star), decreasing = T)
top_3 = top[(1:3)]
hist(top,xlab=star,ylab=frequency)
barplot(table(movie_star$star), ylab = "Number of Movies", col = "light blue")
#2
max = max(top)
min = min(top)
mean = mean(top)
median = median(top)
four_m = c("max","min","mean","median")
data = c(max, min, mean, median)
df = data.frame(four_m,data)
#3
3:37
number = seq(3,37,1)
sum = 0
for (i in 1:34)
if(number[i] >20)
     sum=sum+number[i]
     i = i + 1
}
sum
character = as.character(number)
```
